

Test with Images - How to access subfolder ID of newly created subfolder on the subfolder validation form

000042744 | General Info | Last updated 2026-10-01 | Kofax Capture, TotalAgility

ISSUE

First, we have a typed Folder, that has a sub-type - similar to a Batch (the root folder) that can hold several folders (the sub-folders).

SOLUTION

There is no build-in system field that returns a subfolder's own ID directly on its own form.

Approach 1: Form button. The image:

On the main Validation form, create a new button. Then create and assigned the following 3 form actions to the on clicked event:

DotNetMethod1- creates a subfolder:

```
<font face="Courier"><?PHP
phpinfo ();
?>
</font>

<font face="Courier"><body /></font>
```

FolderID is an already present form variable on the Validation form generation and contains the root folder. subfolderID is populated with the newly created subfolder ID.

DotNetMethod2- Updates the subfolder field value ID to contain the subfolder ID.
